

**In The Claims:**

1. (original) An in-situ straw container comprising:  
a container body for enclosing a liquid product therein; and  
a pipe having a first external opening and integrally formed with the container body, wherein an interior volume of the pipe is substantially separated from an interior volume of the container body by a sidewall, and the interior volume of the pipe communicates with the interior volume of the container body via at least an internal opening proximate to a bottom of the container body, thereby the liquid product within the container body is sucked out through the first external opening of the pipe.
2. (original) The in-situ straw container of claim 1, wherein the pipe further externally protrudes over the container body.
3. (original) The in-situ straw container of claim 1, wherein the first external opening of the pipe is punched by means of a straw head to drink the liquid product within the container body.
4. (original) The in-situ straw container of claim 1, wherein a cap and a covering further cover the first external opening of the pipe.
5. (original) The in-situ straw container of claim 1, wherein the pipe further terminates into a manually removable cover member that externally closes the pipe, wherein the manually removable cover member is integrally formed with the pipe.
6. (original) The in-situ straw container of claim 1, wherein a second external opening is further integrated to the in-situ straw container to allow exterior air to penetrate the in-situ straw container as the enclosed liquid product is sucked out through the first external opening of the pipe.
7. (original) The in-situ straw container of claim 6, wherein the second external opening is exposed via punching.

**Claims 8-19 (canceled)**

20. (newly added) The in-situ straw container of claim 1, wherein the second external opening is sealed which is integrally formed with the container body.

21. (newly added) The in-situ straw container of claim 1, wherein the second external opening externally protrudes over the container body.

22. (newly added) The in-situ straw container of claim 21, wherein the second external opening is sealed by a cap.

23. (newly added) The in-situ straw container of claim 1, wherein the first external opening is sealed which is integrally formed with the container body.

24. (newly added) The in-situ straw container of claim 23, wherein the first external opening is exposed via punching with a straw head.
